

# AVMLabs CRA Website

Complete Workflow, UX/UI Design, Architecture & Implementation Plan

Technology: React + Next.js + TypeScript + Tailwind CSS

**Source basis:** CRA Workflow Wireframe / Meeting Recording dated August 26, 2026. The meeting defines the public website requirement, Customer and CRS/CRA role-based experience, referrals, discounts, business tracking and incentives.

## Executive Summary

The website should be designed as a complete diagnostic platform rather than a simple marketing website. It needs a public AVMLabs experience plus authenticated Customer and CRA/CRS experiences. The CRA/CRS role can add referred customers, track their activity and see business generated and incentive information. The exact incentive percentages and several business rules were not finalized in the meeting and therefore should remain backend-driven.

# 1. Overall Product Structure

- PUBLIC WEBSITE → Home, Tests, Packages, Test Details, Booking, About, Contact, Login/Register.
- INDIVIDUAL CUSTOMER → Dashboard, My Orders, My Reports, Profile and Addresses.
- CRA / CRS USER → Dashboard, My Referrals, Add Referral, Referral Details, Incentives, Performance and Profile.
- ADMIN → Not fully specified in the source document; keep the architecture extensible for a future admin portal.

# 2. Core CRA Workflow

- CRA Login → CRA Dashboard → Add Referral → Customer is associated with CRA → Customer books a diagnostic test → Order is linked to referral/CRA → Business generated is tracked → Incentive is calculated by backend rules → CRA dashboard is updated.
- The meeting describes CRS users as people who can refer family/friends and receive a benefit/discount based on the referral. It also describes dashboard information such as number of referrals, tests/orders taken, business generated and incentive earned.

# 3. Public Website Pages

- / — Homepage
- /tests — Test Listing
- /tests/[slug] — Test Details
- /packages — Package Listing
- /packages/[slug] — Package Details
- /about — About AVMLabs
- /contact — Contact
- /faq — FAQ
- /locations — Locations
- /login — Login
- /register — Registration
- /booking — Booking flow
- /booking/review — Review
- /booking/success — Confirmation

# 4. Homepage UX

- Sticky responsive navbar with AVMLabs branding, Home, Tests, Packages, Health Checkups, About, Contact, Search, Login and Book Now.
- Hero section with test/package search, Book a Test and Explore Tests CTAs, plus Home Collection and Visit Center options.
- Popular Tests section with category browsing and prices.

- Health Packages section.
- How It Works section covering selection, collection, scheduling, sample collection and reports.
- Service-focused benefits, testimonials, FAQ, final booking CTA and footer.
- Avoid unsupported claims or invented statistics.

## 5. Test Listing & Test Details

- Test listing should support search and filters for test type, sample type, conditions and department, matching the meeting discussion.
- Test cards should show test name, category, sample type, parameter count, TAT, price, details and booking CTA.
- Test detail should show price, sample type, parameters, TAT, preparation, parameter list, FAQ and Book This Test.
- Laboratory product data should be API-driven rather than hardcoded. The meeting also notes that some tests/parameters were missing from the system and needed Product Master updates.

## 6. Booking Workflow

- Step 1 — Select Test
- Step 2 — Select Collection Method: Home Collection or Visit Center
- Step 3 — Patient Information
- Step 4 — Location
- Step 5 — Date and Available Slot
- Step 6 — Review Booking
- Step 7 — Payment
- Step 8 — Booking Success
- The meeting specifically discusses showing available slots and recommends using 'Available Slot' rather than 'Preferred Time' so customers do not assume a requested time is guaranteed.

## 7. Patient Information

- Full Name, Age, Gender, Mobile Number, Email, Date of Birth, Address, City, Pincode and Additional Instructions.
- Make the patient form reusable and support multiple patients if required by the final business requirement.
- Provide field validation, loading states, API errors and clear success/error feedback.

## 8. Booking Review & Confirmation

- Review screen should show patient details, selected tests, collection method, address/location, date, available slot, test price, collection charges if applicable, discount and total.
- Confirmation should show Booking ID, patient, collection method, date, available slot and actions such as View Booking, Download Confirmation and My Orders.
- The source states that booking confirmation should be generated to the registered customer email/mobile.

## 9. Customer Portal

- Navigation: Dashboard, Find Tests, My Orders, My Reports, Addresses, Profile, Support and Logout.
- Dashboard: welcome message, upcoming booking, recent orders, quick actions and recent reports.
- My Orders: order ID, date, tests, amount, status and details.
- My Reports: report list and download/view actions.
- Keep the UX simple for non-technical customers, with large touch-friendly controls on mobile.

## 10. CRA Dashboard

- Sidebar: Dashboard, My Referrals, Add Referral, Incentives, Referral Performance, Profile, Help and Logout.
- Top bar: search, notifications and user profile.
- Referral Code card with Copy and Share actions.
- KPI cards: Total Referrals, Active Customers, Total Business Generated and Total Incentive Earned.
- Performance section: monthly referrals, business generated and incentive earned.
- Recent Referrals table: customer, referral date, orders, business, incentive and status.
- Quick actions: Add Referral, Share Referral Code, View Incentives and View Referrals.

## 11. Add Referral

- Fields: Full Name, Mobile Number, Email Address, Relationship and optional notes.
- Relationship examples discussed in the meeting include family members and friends.
- After submission, show referral name, referral ID, referral code/link, Copy and Share actions.
- Validate required fields, phone number and email; include loading, success and API-error states.

## 12. Referral Management

- Referral list should include search, filter, date range and optional export.
- Summary cards: Total, Active, Completed and Pending.
- Table: Customer, Mobile, Referral Date, Orders, Business Generated, Incentive, Status and Actions.
- Referral detail should include customer information, referral history, orders, business, incentive and timeline.
- Provide empty, loading, error and mobile-card states.

## 13. Incentives

- Show Total Business Generated, Total Incentive Earned, Pending Incentive and Paid Incentive.
- Show monthly performance.

- Do not hardcode an incentive percentage. The meeting mentions percentages only as examples; the final rule was not confirmed.
- Frontend should consume incentive percentage/amount/status from backend APIs.

## 14. Referral Code & Attribution

- CRA should have a referral code and shareable referral link.
- Example architecture: `/register?ref=CODE` or `/book?ref=CODE`.
- Flow: Customer → Referral Code → Booking → Order → CRA attribution → Business → Incentive.
- Backend must be the source of truth for attribution and incentive calculations.

## 15. Role-Based Authentication

- Use a role-aware authentication model: CUSTOMER, CRA and future ADMIN.
- After login, route CUSTOMER to `/customer/dashboard` and CRA to `/cra/dashboard`.
- Do not rely only on hiding frontend menu items. Backend authorization must enforce permissions.
- Use protected layouts/routes and server-side validation where appropriate in Next.js.

## 16. Recommended Next.js Project Structure

- `src/app/page.tsx`
- `src/app/tests/page.tsx` and `src/app/tests/[slug]/page.tsx`
- `src/app/packages/page.tsx` and `src/app/packages/[slug]/page.tsx`
- `src/app/booking/*` for booking steps
- `src/app/login/page.tsx` and `src/app/register/page.tsx`
- `src/app/customer/*` for customer portal
- `src/app/cra/*` for CRA portal
- `src/components/ui`, `navbar`, `footer`, `tests`, `booking`, `customer` and `cra`
- `src/lib/api.ts`, `auth.ts`, `utils.ts`, `validations.ts`
- `src/hooks`, `src/types` and `src/constants`

## 17. Reusable Component System

- Base UI: Button, Input, Select, Modal, Drawer, Tabs, Badge, Card, Table, Pagination, Dropdown, Toast, Skeleton and EmptyState.
- Healthcare components: TestCard, PackageCard, TestParameterList, SampleTypeBadge, TATBadge, PriceDisplay, BookingStepper, PatientForm, SlotPicker and OrderSummary.
- CRA components: ReferralCard, ReferralTable, ReferralStatus, IncentiveCard, ReferralCodeCard and PerformanceChart.

- Build reusable components first to avoid duplicated page-level implementations.

## 18. API Architecture

- Organize API/service modules around Auth, Users, Tests, Packages, Locations, Availability, Bookings, Orders, Payments, Referrals, Incentives and Reports.
- Use UI → Hooks → Service/API → Backend → Database.
- Do not calculate business incentives or authoritative discounts in the frontend.
- Frontend should consume API-provided price, discount, incentive and availability values.

## 19. Suggested Type Models

- UserRole = CUSTOMER | CRA | ADMIN.
- Referral: id, referralCode, customerId, craId, status, createdAt.
- Order: id, customerId, referralId, craId, amount, status.
- Incentive: id, craId, orderId, businessAmount, incentiveAmount, status.
- Keep types aligned with actual backend contracts once approved.

## 20. Design System

- Use consistent typography hierarchy: Display, H1, H2, H3, Body, Small and Caption.
- Use a predictable spacing scale such as 4, 8, 12, 16, 24, 32, 48, 64 and 80.
- Use consistent border radius and card treatments.
- Visual language: premium healthcare SaaS, clean, professional, trustworthy, spacious and accessible.
- Avoid excessive gradients, excessive animation, clutter and giant hero sections that hide the actual tests.

## 21. Development Phases

- Phase 1 — Design system and reusable components.
- Phase 2 — Public website: Navbar, Footer, Homepage, Tests, Test Details, Packages, About and Contact.
- Phase 3 — Authentication: Login, Register, OTP if required, role detection and protected routes.
- Phase 4 — Customer: Dashboard, Booking, Orders, Reports, Profile and Addresses.
- Phase 5 — CRA: Dashboard, Referral Code, Add Referral, Referral List, Referral Details, Incentives, Performance and Profile.
- Phase 6 — API integration: Tests, Packages, Locations, Availability, Authentication, Booking, Payment, Referral, Incentive and Reports.
- Phase 7 — Testing: responsive, auth, role access, booking, referrals, discounts, incentives, API errors, loading/empty states and security.

## 22. Items Not Finalized in the Source

- Exact CRA incentive percentage.
- Exact customer discount percentage.
- Incentive calculation and settlement rules.
- Referral validity period.
- Whether a customer can belong to multiple CRAs.
- Cancellation/refund effect on incentives.
- Minimum business/order threshold.
- Exact CRA registration/approval workflow.
- Admin screens and final API/database contracts.
- These must be confirmed before hardcoding business behavior.

## 23. AI UI Design Prompts

### Homepage Prompt

Design a modern premium diagnostic laboratory website homepage for AVMLabs India. Technology target: React, Next.js, TypeScript and Tailwind CSS. Include a sticky responsive navbar, healthcare-focused hero, prominent test/package search, Book a Test and Explore Tests CTAs, Home Collection and Visit Center options, Popular Tests, Health Packages, How It Works, service-focused benefits, testimonials, FAQ, final booking CTA and footer. Use clean healthcare SaaS styling, generous whitespace, rounded cards, subtle shadows, accessible typography and responsive desktop/tablet/mobile layouts. Avoid unsupported claims and excessive gradients.

### CRA Dashboard Prompt

Design a premium CRA / Customer Referral Associate dashboard for AVMLabs using Next.js, React, TypeScript and Tailwind CSS. Include sidebar navigation, top bar, referral code card with Copy/Share, KPI cards for total referrals, active customers, business generated and incentive earned, monthly performance chart, recent referrals table and quick actions. Include loading, empty and error states. Use a professional medical SaaS interface with clean cards, subtle borders, accessible typography and responsive mobile layouts.

### Add Referral Prompt

Design the AVMLabs CRA Add Referral page. Include breadcrumb, page heading, explanation, form fields for customer name, mobile, email, relationship and optional notes, referral code preview, Add Referral and Cancel actions. After success show referral ID, referral link, Copy and Share actions. Include validation, loading, success and API error states. Use premium healthcare SaaS styling and mobile-first responsive UX.

### Referral Management Prompt

Design a CRA Referral Management page for AVMLabs. Include search, filter, date range and optional export, summary cards, referral table with customer, mobile, referral date, orders, business, incentive and status, plus a customer detail drawer with history, orders, business, incentive and timeline. Include empty/loading/error/mobile states. Use a clean, professional diagnostic SaaS style.

### Customer Dashboard Prompt

Design an AVMLabs individual customer dashboard with Dashboard, Find Tests, My Orders, My Reports, Addresses, Profile, Support and Logout. Include welcome section, upcoming booking card, quick actions, recent orders and recent reports. Use large touch-friendly controls, clear status badges, strong readability and responsive healthcare portal design.

### Booking Flow Prompt

Design a complete AVMLabs diagnostic booking wizard: Select Test, Collection Method, Patient Information, Location, Available Date, Available Slot, Review, Payment and Success. Collection methods are Home Collection and Visit Center. Use the label Available Slot rather than Preferred Time. Include validation, disabled unavailable slots, loading states, API errors, pricing summary and booking confirmation. Make it mobile-first and production-ready.

## 24. Master AI Coding Prompt

Build a production-ready AVMLabs diagnostic laboratory website using Next.js, React, TypeScript and Tailwind CSS.

Support public visitors, individual customers and CRA/CRS referral users. Build a public website with Home, Tests, Test Details, Packages, Package Details, About, Contact, Login and Register.

Create API-driven test listing and details with search and filters for test type, sample type, conditions and department. Display test name, sample type, parameters, TAT and price.

Implement a multi-step booking wizard: test selection, collection method, patient information, location, available date, available slot, review, payment and success. Collection methods are Home Collection and Visit Center. Use "Available Slot", not "Preferred Time".

Create Customer Portal pages: Dashboard, My Orders, Order Details, Reports, Profile and Addresses.

Create CRA Portal pages: Dashboard, Referral Code, Add Referral, Referral List, Referral Details, Incentives, Performance and Profile. The CRA dashboard must display API-driven total referrals, active referrals, business generated, incentive earned and recent referrals.

Implement referral attribution, referral code/link sharing and referral order tracking. Do not hardcode incentive percentages or discount rules. These must come from backend APIs/configuration.

Use role-aware authentication with CUSTOMER, CRA and future ADMIN roles. Protect routes and enforce authorization through the backend.

Use architecture: app, components, hooks, lib, services and types. Create reusable UI, healthcare, booking and CRA components. Include loading skeletons, empty states, errors, validation, toast notifications, confirmation dialogs and responsive layouts.

Never put authoritative business calculations inside UI components. Use UI → hooks → service/API → backend → database.

The final design should feel like a real production diagnostic healthcare platform: professional, trustworthy, modern, clean, spacious, accessible and responsive. Avoid unsupported medical claims, excessive gradients, clutter and generic AI-template styling.

Development order: design system → public website → authentication → customer portal → CRA portal → API integration → end-to-end testing.

## 25. Final Implementation Checklist

- Design system approved
- Homepage approved
- Test listing and filters approved
- Test details approved
- Package pages approved
- Booking flow approved
- Available slot UX approved
- Customer login/register approved
- Customer dashboard approved
- CRA login/register approved
- CRA dashboard approved
- Add Referral approved
- Referral management approved
- Incentive dashboard approved
- Referral attribution API confirmed
- Discount rules confirmed
- Incentive rules confirmed
- Product Master data verified
- Test/parameter data verified
- Location API confirmed
- Availability API confirmed
- Booking API confirmed
- Payment flow confirmed
- Reports flow confirmed
- Role-based authorization tested
- Desktop/tablet/mobile tested
- Loading/error/empty states tested
- End-to-end customer booking tested
- End-to-end CRA referral tested
- Security and permission testing completed
- Production deployment checklist completed

**Source note:** This document is based primarily on the uploaded CRA Workflow wireframe meeting transcript. Items explicitly marked as not finalized should be confirmed with the business/IT team before implementation.
